# PROPERTY LISTING PLATFORM

## System Requirements Specification

---

You need to consume APIs exposed by Backend application in Angular to make application work as FULLSTACK

### BACKEND-SPRING BOOT RESTFUL APPLICATION

## 1 PROJECT ABSTRACT

The **Property Listing Platform** is a FullStack Application with a backend implemented using Spring Boot with a MySQL database and a frontend developed using Angular. It serves as a comprehensive platform for managing and listing properties for sale.

Following is the requirement specifications:

|                                 |                                      |
|---------------------------------|--------------------------------------|
|                                 | Property Listing Platform            |
|                                 |                                      |
| Modules                         |                                      |
| 1                               | Property                             |
|                                 |                                      |
| Property Module Functionalities |                                      |
|                                 |                                      |
| 1                               | Create a Property                    |
| 2                               | Update the existing Property details |
| 3                               | Get the Property by Id               |
| 4                               | Get all Properties                   |
| 5                               | Delete an Property                   |
| 6                               | Search for Property by Name          |
| 7                               | Search for Property by Price         |
| 8                               | Search for Property by Category      |

## 2 ASSUMPTIONS, DEPENDENCIES, RISKS / CONSTRAINTS

### 2.1 PROPERTY CONSTRAINTS

- When fetching a Property by ID, if the property ID does not exist, the operation should throw a custom exception.
- When updating a property, if the property ID does not exist, the operation should throw a custom exception.
- When removing a property, if the property ID does not exist, the operation should throw a custom exception.

### Common Constraints

- For all rest endpoints receiving @RequestBody, validation check must be done and must throw custom exception if data is invalid
- All the business validations must be implemented in dto classes only.
- All the database operations must be implemented on entity object only
- Do not change, add, remove any existing methods in service layer
- In Repository interfaces, custom methods can be added as per requirements.
- All RestEndpoint methods and Exception Handlers must return data wrapped in **ResponseEntity**

## 3 BUSINESS VALIDATIONS

- Name is not null, min 3 and max 20 characters.
- The number of rooms should not be null and should be a min 5 and max 200.
- Price should not be null, should be a non-negative value and should not exceed 9999.
- Category is not null, and select only from APARTMENTS, VILLAS, COTTAGES and HOUSES.

## 4 REST ENDPOINTS

Rest End-points to be exposed in the controller along with method details for the same to be created

### 4.1 PROPERTYCONTROLLER

| URL Exposed                         |                  | Purpose                                   |
|-------------------------------------|------------------|---|
| 1. /properties                      |                  | Fetches all the properties                |
| Http Method                         | GET              |   |
| Parameter                           | -                |   |
| Return                              | List<Properties> |   |
| 2. /properties                      |                  | Add a new properties                      |
| Http Method                         | POST             |   |
| Parameter 1                         | Property         |   |
| Return                              | Property         |   |
| 3. /properties/{id}                 |                  | Delete property with given property id    |
| Http Method                         | DELETE           |   |
| Parameter 1                         | Long (id)        |   |
| Return                              | -                |   |
| 4. /properties/{id}                 |                  | Fetches the property with the given id    |
| Http Method                         | GET              |   |
| Parameter 1                         | Long (id)        |   |
| Return                              | Property         |   |
| 5. /properties/{id}                 |                  | Updates existing product                  |
| Http Method                         | PUT              |   |
| Parameter 1                         | Long (id)        |   |
| Parameter 2                         | Property         |   |
| Return                              | Property         |   |
| 6. /properties/search?name={name}   |                  | Fetches the property with the given name  |
| Http Method                         | GET              |   |
| Parameter 1                         | String (name)    |   |
| Return                              | Property         |   |
| 7. /properties/search?price={price} |                  | Fetches the property with the given price |
| Http Method                         | GET              |   |
| Parameter 1                         | Double (price)   |   |
| Return                              | Property         |   |

|   |                   |  |
|---|-------------------|--|
| 8. /properties/search?category={category} |                   | Fetches the property with the given category |
| Http Method                               | GET               |  |
| Parameter 1                               | String (category) |  |
| Return                                    | Property          |  |

## 5 TEMPLATE CODE STRUCTURE

### 5.1 PACKAGE: COM.YAKSHA.PROPERTYLIST

#### Resources

|   |   |                     |
|---|---|---------------------|
| <b>PropertyListApplication</b><br>(Class) | This is the Spring Boot starter class of the application. | Already Implemented |
|---|---|---------------------|

### 5.2 PACKAGE: COM.YAKSHA.PROPERTYLIST.REPOSITORY

#### Resources

| Class/Interface                | Description   | Status                 |
|--------------------------------|---|------------------------|
| <b>PropertyDAO (interface)</b> | <ul style="list-style-type: none"> <li>Repository interface exposing CRUD functionality for Property Entity.</li> <li>You can go ahead and add any custom methods as per requirements.</li> </ul> | Partially implemented. |

### 5.3 PACKAGE: COM.YAKSHA.PROPERTYLIST.SERVICE

#### Resources

| Class/Interface                    | Description   | Status               |
|------------------------------------|---|----------------------|
| <b>PropertyService (interface)</b> | <ul style="list-style-type: none"> <li>Interface to expose method signatures for property related functionality.</li> <li>Do not modify, add or delete any method.</li> </ul> | Already implemented. |

## 5.4 PACKAGE: COM.YAKSHA.PROPERTYLIST.SERVICE.IMPL

### Resources

| Class/Interface             | Description   | Status             |
|-----------------------------|---|--------------------|
| PropertyServiceImpl (class) | <ul style="list-style-type: none"><li>• Implements PropertyService.</li><li>• Contains template method implementation.</li><li>• Need to provide implementation for property related functionalities.</li><li>• Do not modify, add or delete any method signature</li></ul> | To be implemented. |

## 5.5 PACKAGE: COM.YAKSHA.PROPERTYLIST.CONTROLLER

### Resources

| Class/Interface            | Description   | Status            |
|----------------------------|---|-------------------|
| PropertyController (Class) | <ol style="list-style-type: none"><li>1. Controller class to expose all rest-endpoints for property related activities.</li><li>2. May also contain local exception handler methods</li></ol> | To be implemented |

## 5.6 PACKAGE: COM.YAKSHA.PROPERTYLIST.DTO

### Resources

| Class/Interface     | Description  | Status                 |
|---------------------|--|------------------------|
| PropertyDTO (Class) | Use appropriate annotations from the Java Bean Validation API for validating attributes of this class. | Partially implemented. |

## 5.7 PACKAGE: COM.YAKSHA.PROPERTYLIST.ENTITY

### Resources

| Class/Interface         | Description  | Status                 |
|-------------------------|--|------------------------|
| Property (Class)        | <ul style="list-style-type: none"><li>• This class is partially implemented.</li><li>• Annotate this class with proper annotation to declare it as an entity class with propertyId as primary key.</li><li>• Map this class with a property table.</li><li>• Generate the propertyId using the IDENTITY strategy</li></ul> | Partially implemented. |
| PropertyCategory (Enum) | <ul style="list-style-type: none"><li>• This enum is already implemented.</li></ul>  | Already implemented.   |

## 5.8 PACKAGE: COM.YAKSHA.PROPERTYLIST.EXCEPTION

### Resources

| Class/Interface                          | Description  | Status                 |
|--|--|------------------------|
| <b>ErrorResponse (Class)</b>             | <ul style="list-style-type: none"><li>Object of this class is supposed to be returned in case of exception through exception handlers</li></ul>  | Already implemented.   |
| <b>ResourceNotFoundException (Class)</b> | <ul style="list-style-type: none"><li>Custom Exception to be thrown when trying to fetch or delete the user info which does not exist.</li><li>Need to create Exception Handler for same wherever needed (local or global)</li></ul> | Partially implemented. |
| <b>RestExceptionHandler (Class)</b>      | <ul style="list-style-type: none"><li>Custom Exception to be thrown when trying to fetch or delete the user info which does not exist.</li><li>Need to create Exception Handler for same wherever needed (local or global)</li></ul> | Partially implemented. |

## 6 CONSIDERATIONS

- A. There is no roles in this application
- B. You can perform the following possible action

|          |
|----------|
| Property |
|----------|

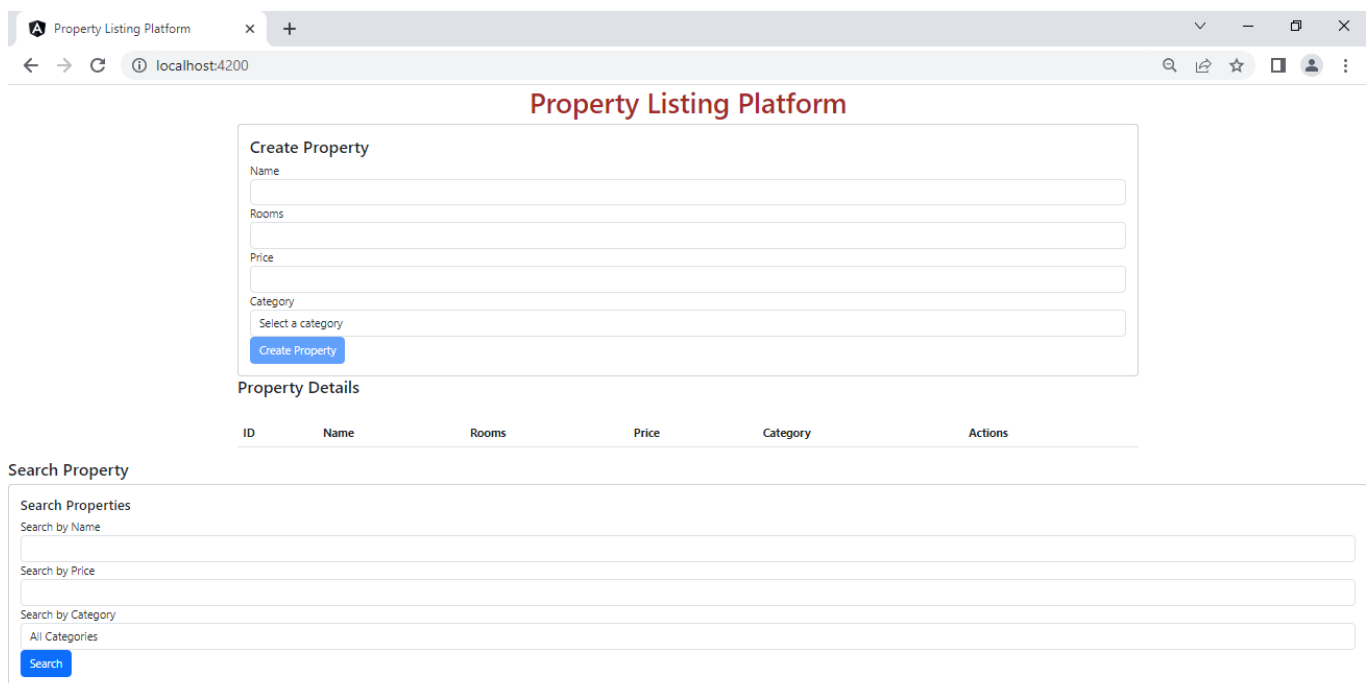

# FRONTEND-ANGULAR SPA

## 1 PROBLEM STATEMENT

Property Listing Platform is SPA (Single Page Application), it allows to manage the properties with functionalities to create a new property, update an existing property, get detailed information, and search property.

## 2. PROPOSED PROPERTY LISTING PLATFORM WIREFRAME

### 2. 1 HOME PAGE

The wireframe shows a web browser window with the title 'Property Listing Platform' and the URL 'localhost:4200'. The page has a red header with the title 'Property Listing Platform'. Below the header, there is a 'Create Property' form with fields for Name, Rooms, Price, and Category, and a 'Create Property' button. Below the form is a 'Property Details' table with columns: ID, Name, Rooms, Price, Category, and Actions. Below the table is a 'Search Property' section with three search filters: Search by Name, Search by Price, and Search by Category, and a 'Search' button.

**Property Listing Platform**

**Create Property**

Name

Rooms

Price

Category

Select a category

**Property Details**

| ID | Name | Rooms | Price | Category | Actions |

### 3. BUSINESS-REQUIREMENT:

As an application developer, develop the Property Listing Platform App (Single Page App) with below guidelines:

| User Story # | User Story Name | User Story  |
|--------------|-----------------|---|
| US_01        | Home Page       | As a user I should be able to visit the home page as the default page. Where I can see a form to create or update the property, a list of all properties with options to edit and delete any property and at last there should be a form to search any property on its name, price or category criteria.  |
| US_01        | Home Page       | <p>As a user I should be able to see the homepage and perform all operations:</p> <p>Acceptance criteria:</p> <ol style="list-style-type: none"><li>As a user I should be able to furnish the following details at the time of creating the property.<ol style="list-style-type: none"><li>Name</li><li>Rooms</li><li>Price</li><li>Category</li></ol></li><li>Create Property button should be disabled until all fields are validated.</li><li>Update Property button should be displayed when you click on the Edit button.</li><li>Update Property button should be disabled until all fields are validated.</li><li>Name field min length is 3 and max length 20.</li><li>Rooms field min value is 5 and max value 200.</li><li>Price field min value is 0 and max value 9999.</li><li>All fields are mandatory. If any field is missing or if any constraint is not satisfied then must show a message.</li><li>Property Form control names should be case sensitive and they should be like as follows:<br/><div>name</div><div>rooms</div><div>price</div><div>category</div></li></ol> |

|  |  |   |
|--|--|---|
|  |  | <p>10. Search form fields are case sensitive and they should be like as follows:</p> <p>name</p> <p>price</p> <p>category</p> <p>These 3 fields are not mandatory in the search form.</p> |
|  |  |   |

## 7 EXECUTION STEPS TO FOLLOW FOR BACKEND

1. All actions like build, compile, running application, running test cases will be through Command Terminal.
2. To open the command terminal the test takers need to go to the Application menu (Three horizontal lines at left top) -> Terminal -> New Terminal.
3. cd into your backend project folder
4. To build your project use command:  
**mvn clean package -Dmaven.test.skip**
5. To launch your application, move into the target folder (**cd target**). Run the following command to run the application:  
**java -jar <your application jar file name>**
6. This editor Auto Saves the code.
7. If you want to exit(logout) and continue the coding later anytime (using Save & Exit option on Assessment Landing Page) then you need to use **CTRL+Shift+B**-command compulsorily on code IDE. This will push or save the updated contents in the internal git/repository. Else the code will not be available in the next login.
8. These are time bound assessments the timer would stop if you logout and while logging in back using the same credentials the timer would resume from the same time it was stopped from the previous logout.
9. To test any Restful application, the last option on the left panel of IDE, you can find ThunderClient, which is the lightweight equivalent of POSTMAN.
10. To test any UI based application the second last option on the left panel of IDE, you can find Browser Preview, where you can launch the application.
11. Default credentials for MySQL:
  - a. Username: **root**
  - b. Password: **pass@word1**
11. To login to mysql instance: Open new terminal and use following command:
  - a. **sudo systemctl enable mysql**
  - b. **sudo systemctl start mysql**
  - c. **mysql -u root -p**  
**The last command will ask for password which is 'pass@word1'**
12. Mandatory: Before final submission run the following command:  
**mvn test**
13. You need to use **CTRL+Shift+B** - command compulsorily on code IDE, before final submission as well. This will push or save the updated contents in the internal git/repository, and will be used to evaluate the code quality.

## 8 EXECUTION STEPS TO FOLLOW FOR FRONTEND

1. All actions like build, compile, running application, running test cases will be through Command Terminal.
2. To open the command terminal the test takers, need to go to Application menu (Three horizontal lines at left top) -> Terminal ->New Terminal.
3. This is a web-based application, to run the application on a browser, use the internal browser in the environment.
4. You can follow series of command to setup Angular environment once you are in your project-name folder:
  - a. npm install -> Will install all dependencies -> takes 10 to 15 min
  - b. npm run start -> To compile and deploy the project in browser. You can press <Ctrl> key while clicking on localhost:4200 to open project in browser -> takes 2 to 3 min
  - c. npm run test -> to run all test cases. **It is mandatory to run this command before submission of workspace -> takes 5 to 6 min**
5. You need to use **CTRL+Shift+B** - command compulsorily on code IDE, before final submission as well. This will push or save the updated contents in the internal git/repository, and will be used to evaluate the code quality.
